PROFILE SUMMARY

Results-driven **System Engineer** and **Backend Developer** specializing in **high-throughput, distributed systems**, native **C++** toolchains, and **scalable microservices**. Skilled in architecting **low-latency**, **fault-tolerant Go** and **Node.js** APIs, and optimizing **PostgreSQL**, **MongoDB**, and **Redis** pipelines. Adept at applying **multithreading**, **concurrency**, and **memory management** to ship developer infrastructure that measurably improves **throughput** and **reliability**.

EDUCATION

Vellore Institute of Technology (VIT) 2022 – 2026
B.Tech in Computer Science and Engineering — CGPA: 7.8

TECHNICAL SKILLS

Languages: C++, Go, C, JavaScript, TypeScript, Python, SQL, Bash/PowerShell
Systems & Core: STL, Multithreading, Concurrency, Memory Management, OOP, RAII, Process Lifecycle, File I/O
Backend & Core: Node.js, Express.js, Microservices, REST APIs, RabbitMQ, WebSocket, JWT, OAuth2, PostgreSQL, MongoDB, Redis, AWS (EC2, S3), Google Cloud Platform (GCP)
Tools & Environment: Docker, CI/CD, Jenkins, Prometheus, Grafana, CMake, Git/GitHub, Linux/Unix

EXPERIENCE

OSINTERS HUB (OPC) PVT LTD — Software Engineer Intern Apr 2026 – Jun 2026

- Built scalable **Node.js microservices** and optimized **database aggregation pipelines** to speed up data retrieval, cutting query latency by **15%** and sustaining **10,000+ daily queries**.
- Designed automated **unit testing** frameworks and rolled out **CI/CD** pipelines to catch regressions earlier, cutting post-deployment defects by **20%** and speeding up release cycles by **30%**.

PROJECTS

HaloMail – Meeting Scheduling & Contact Form Platform Live — GitHub
Go, gRPC/ConnectRPC, Protocol Buffers, PostgreSQL, Redis, Docker, OpenTelemetry

- Built **six modular Go services** using clean architecture, **gRPC/ConnectRPC**, and **Protocol Buffers**; generated a typed **TypeScript SDK** to keep client integrations aligned with backend API contracts.
- Implemented **JWT/API-key authentication**, **PostgreSQL** persistence, and **Redis** caching and rate limiting; integrated **Google Calendar/Meet via OAuth2** with availability-based bookings and queued email notifications.
- Added **signed webhooks** and audit logs; containerized services with **Docker Compose** and added **OpenTelemetry tracing**, structured logs, and health checks to diagnose failures and monitor service readiness.

Unigo Delivery – Multi-Tenant Food Delivery Platform GitHub
Node.js, Express.js, MongoDB, Razorpay API, Google OAuth2, JWT

- Built a fault-tolerant **Node.js** microservice on **Express** and **MongoDB** with stateless **JWT** auth and **Google OAuth2**, enforcing secure **RBAC** for **1,000+ concurrent user sessions**.
- Integrated the **Razorpay API** with webhook-driven asynchronous event processing for the checkout flow, guaranteeing **idempotent** state transitions and a **high transaction success rate**.
- Wrote **MongoDB aggregation pipelines** and tuned indexing strategies for real-time vendor dashboards, cutting query latency by **40%** for live inventory tracking.

Book CLI – Cross-Platform Master Shell GitHub
C++, CMake, STL, OS Shell Scripting (Bash/PowerShell), File I/O

- Built a zero-dependency **C++** CLI workspace manager with an **O(1) command router** via `std::unordered_map`, dispatching terminal input to heap-allocated commands in **under 2 milliseconds**.
- Wrote a recursive filesystem indexer and persistent state manager with **C++** `<filesystem>` to abstract path navigation, indexing **10,000+ local files** across sessions in sub-second time.
- Built a context-aware task runner and **Git** macro engine on `std::error_code` safety guarantees to route builds to native toolchains, eliminating subprocess-induced crashes entirely (**100%**).

Harbour – Developer Workspace & Process Manager GitHub
C++, STL, Multithreading, Filesystem APIs, Git Integration, OS Process Management

- Built a concurrent **C++** workspace tool using **STL** and **multithreading** to run filesystem parsing in the background, keeping the UI responsive on repos over **2GB+**.
- Added **OS-level process lifecycle management** and native **Git** workflows to centralize project builds, cutting context-switching and lifting developer speed by **30%**.
- Built a modular, object-oriented layer on **RAII** principles with local persistence to track **50+ cross-session metadata properties**, roles, and milestones independently of the UI.

CERTIFICATIONS

- **Networking and Security Workshop** — I-Medita & VIT Bhopal (Cisco Partnered), Sep 2024
